

Tower Inspections, Inc.

Muskogee, OK, USA

Project Overview

Tower Inspections, Inc. has performed inspection, maintenance, and installation of towers and associated antennas since 1962. A trusted resource of the US military, the NOAA and more, the Tower Inspections team works toward enhancing the safety, performance, and reliability of their customers' operations, emphasizing safety, compliance, and care for the environment.

The Challenge

To achieve that mission, however, the company's workers needed to safely access everything from 15' transmission tower to 1,500' VLF towers used for submarine communications. While their tasks only require temporary access to any given structure, the conditions vary in terms of tower height and the surrounding terrain, the regulations of the countries where they operate, and the practices they must adopt to minimize environmental impact. Combined, all those considerations called for modular equipment that could mold to any worksite circumstances.

The Solution

That was why Tower Inspections, Inc. approached Tractel to help protect their workers and achieve their goals. Together, we implemented a system tailored to their needs that combined our Scafor Manual Hoists and Skysafe Modular Platforms. With multi-tier, non-permanent platform setups and hoists that are adaptable to any stirrups, the Tower Inspections team can successfully navigate any tower inspection and maintenance setting in the world.

Tractel: The Safety Solution That Integrates with Your Facilities and Teams at Speed

For decades, Tractel has provided reliable, compliant safety equipment to commercial and industrial properties worldwide. By integrating not only with our partners' existing safety strategies but also with their teams and timelines, our experts ensure solutions that protect both employees and businesses. When your team has projects that require high quality at speed, contact us to learn what's possible when you choose Tractel.
